=====

The dome above labeled 4 meter planetarium dome WITH OVERLAPPING SEAMS is a Gore dome designed with overlapping seams in mind. Each gore section will have an extra 3 centimeters on EACH EDGE to be used for attaching to another gore section's seam. This method requires 10 gore sections instead of 11. The height listed in column 1 is the **distance in meters** the next width should be marked from the bottom of the gore. This is important. Each width going up the gore section should be ~20 cm higher than the next, but use the height's specified in the table. Again, each height measurement is from the **BOTTOM** of the gore and is not the distance in between each part.
